B   EOM Calculation

Consider a quantum harmonic oscillator described by the Hamiltonian

$$\hat{H} = \hbar\omega(\hat{a}^\dagger\hat{a} + 1/2). \tag{1}$$

Consider also that the quantum harmonic oscillator is subject to a temperature bath and is continuously measured. The system then evolves according to the master equation

$$\partial_t\hat{\rho} = -\frac{i}{\hbar}[\hat{H}, \hat{\rho}] + \gamma(\bar{n} + 1)\mathcal{D}[\hat{a}]\hat{\rho} + \gamma\bar{n}\mathcal{D}[\hat{a}^\dagger]\hat{\rho} + \lambda\mathcal{D}[\hat{A}]\hat{\rho} \tag{2}$$

where γ is the damping rate, $\bar{n}$ is the thermal occupancy defined as

$$\bar{n} = \frac{1}{e^{\hbar\omega/k_BT} - 1}, \tag{3}$$

λ is the measurement rate, $\hat{A}$ is the measurement operator, and $\mathcal{D}[\hat{O}]$ is the Lindblad super operator defined as

$$\mathcal{D}[\hat{O}]\hat{\rho} = \hat{O}\hat{\rho}\hat{O}^\dagger - \frac{1}{2}\{\hat{O}^\dagger\hat{O}, \hat{\rho}\}. \tag{4}$$

Then we also have the quadrature operators defined as

$$\hat{x} = \sqrt{\frac{\hbar}{2m\omega}}(\hat{a} + \hat{a}^\dagger), \quad \hat{p} = i\sqrt{\frac{m\omega\hbar}{2}}(\hat{a} - \hat{a}^\dagger). \tag{5}$$

We want to find the equations of motion when measuring the position quadrature

$$\partial_t\left\langle\hat{x}^2\right\rangle = \text{tr}\left(\hat{x}^2\partial_t\hat{\rho}\right) \tag{6}$$

$$\partial_t\left\langle\hat{p}^2\right\rangle = \text{tr}\left(\hat{p}^2\partial_t\hat{\rho}\right) \tag{7}$$

$$\partial_t\left\langle\{\hat{x}, \hat{p}\}\right\rangle = \text{tr}(\{\hat{x}, \hat{p}\}\partial_t\hat{\rho}). \tag{8}$$

We start by defining the Liouvillian super operator

$$\mathcal{L}\hat{\rho} = -\frac{i}{\hbar}[\hat{H}, \hat{\rho}] + \gamma(\bar{n} + 1)\mathcal{D}[\hat{a}]\hat{\rho} + \gamma\bar{n}\mathcal{D}[\hat{a}^\dagger]\hat{\rho} \tag{9}$$

which turns the master equation into

$$\partial_t \hat{\rho} = \mathcal{L}\hat{\rho} + \lambda \mathcal{D}[\hat{x}]\hat{\rho}. \tag{10}$$

We can then write Eq. (6) as

$$\partial_t \left\langle \hat{x}^2 \right\rangle = \mathrm{tr}\left(\hat{x}^2 \mathcal{L}\hat{\rho}\right) + \mathrm{tr}\left(\hat{x}^2 \lambda \mathcal{D}[\hat{x}]\hat{\rho}\right) \tag{11}$$

and then rewriting the left term using the creation and annihilation operators we get

$$\mathrm{tr}\left(\hat{x}^2 \mathcal{L}\hat{\rho}\right) = \frac{\hbar}{2m\omega} \mathrm{tr}\left((\hat{a}^2 + (\hat{a}^\dagger)^2 + \hat{a}\hat{a}^\dagger + \hat{a}^\dagger\hat{a})\mathcal{L}\hat{\rho}\right) \tag{12}$$

$$= \frac{\hbar}{2m\omega} \left[\mathrm{tr}\left(\hat{a}^2 \mathcal{L}\hat{\rho}\right) + \mathrm{tr}\left((\hat{a}^\dagger)^2 \mathcal{L}\hat{\rho}\right) + \mathrm{tr}\left(\hat{a}\hat{a}^\dagger \mathcal{L}\hat{\rho}\right) + \mathrm{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{L}\hat{\rho}\right)\right] \tag{13}$$

Solving these separately

$$\mathrm{tr}\left(\hat{a}^2 \mathcal{L}\hat{\rho}\right) = -\frac{i}{\hbar} \mathrm{tr}\left(\hat{a}^2 \left[\hat{H}, \hat{\rho}\right]\right) + \gamma(\bar{n} + 1) \mathrm{tr}\left(\hat{a}^2 \mathcal{D}[\hat{a}]\hat{\rho}\right) + \gamma\bar{n}\, \mathrm{tr}\left(\hat{a}^2 \mathcal{D}[\hat{a}^\dagger]\hat{\rho}\right) \tag{14}$$

$$= -i\omega\, \mathrm{tr}\left(\hat{a}^2 \hat{a}^\dagger \hat{a}\hat{\rho}\right) + i\omega\, \mathrm{tr}\left(\hat{a}^2 \hat{\rho}\hat{a}^\dagger \hat{a}\right) \tag{15}$$

$$+ \gamma(\bar{n} + 1)\, \mathrm{tr}\left(\hat{a}^3 \hat{\rho}\hat{a}^\dagger\right) - \frac{\gamma(\bar{n} + 1)}{2} \mathrm{tr}\left(\hat{a}^2 \hat{a}^\dagger \hat{a}\hat{\rho}\right) - \frac{\gamma(\bar{n} + 1)}{2} \mathrm{tr}\left(\hat{a}^2 \hat{\rho}\hat{a}^\dagger \hat{a}\right) \tag{16}$$

$$+ \gamma\bar{n}\, \mathrm{tr}\left(\hat{a}^2 \hat{a}^\dagger \hat{\rho}\hat{a}\right) - \frac{\gamma\bar{n}}{2} \mathrm{tr}\left(\hat{a}^3 \hat{a}^\dagger \hat{\rho}\right) - \frac{\gamma\bar{n}}{2} \mathrm{tr}\left(\hat{a}^2 \hat{\rho}\hat{a}\hat{a}^\dagger\right) \tag{17}$$

Using cyclic permutations of the trace and combining terms we get

$$\mathrm{tr}\left(\hat{a}^2 \mathcal{L}\hat{\rho}\right) = i\omega\, \mathrm{tr}\left(\left[\hat{a}^\dagger\hat{a}, \hat{a}^2\right]\hat{\rho}\right) + \frac{\gamma(\bar{n} + 1)}{2} \mathrm{tr}\left(\left[\hat{a}^\dagger\hat{a}, \hat{a}^2\right]\hat{\rho}\right) + \frac{\gamma\bar{n}}{2} \mathrm{tr}\left(\left[\hat{a}^2, \hat{a}\hat{a}^\dagger\right]\hat{\rho}\right) \tag{18}$$

The commutators are

$$\left[\hat{a}^\dagger\hat{a}, \hat{a}^2\right] = \left[\hat{a}^\dagger, \hat{a}^2\right]\hat{a} = \hat{a}\left[\hat{a}^\dagger, \hat{a}\right]\hat{a} + \left[\hat{a}^\dagger, \hat{a}\right]\hat{a}^2 = -2\hat{a}^2 \tag{19}$$

$$\left[\hat{a}^2, \hat{a}\hat{a}^\dagger\right] = \hat{a}\left[\hat{a}^2, \hat{a}^\dagger\right] = \hat{a}^2\left[\hat{a}, \hat{a}^\dagger\right] + \hat{a}\left[\hat{a}, \hat{a}^\dagger\right]\hat{a} = 2\hat{a}^2 \tag{20}$$

Thus

$$\mathrm{tr}\left(\hat{a}^2 \mathcal{L}\hat{\rho}\right) = -2i\omega\, \mathrm{tr}\left(\hat{a}^2 \hat{\rho}\right) - \gamma(\bar{n} + 1)\, \mathrm{tr}\left(\hat{a}^2 \hat{\rho}\right) + \gamma\bar{n}\, \mathrm{tr}\left(\hat{a}^2 \hat{\rho}\right) = -(\gamma + 2i\omega)\, \mathrm{tr}\left(\hat{a}^2 \hat{\rho}\right) \tag{21}$$

$$= -(\gamma + 2i\omega)\left\langle \hat{a}^2 \right\rangle. \tag{22}$$

By taking the hermition conjugate of the above we get

$$\text{tr}\left((\hat{a}^\dagger)^2 \mathcal{L}\hat{\rho}\right) = (\gamma - 2i\omega)\,\text{tr}\left((\hat{a}^\dagger)^2\hat{\rho}\right) = -(\gamma - 2i\omega)\left\langle(\hat{a}^\dagger)^2\right\rangle. \tag{23}$$

Now we do the same for $\text{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{L}\hat{\rho}\right)$, so

$$\text{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{L}\hat{\rho}\right) = -\frac{i}{\hbar}\text{tr}\left(\hat{a}^\dagger\hat{a}\left[\hat{H},\hat{\rho}\right]\right) + \gamma(\bar{n}+1)\,\text{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{D}[\hat{a}]\hat{\rho}\right) + \gamma\bar{n}\,\text{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{D}[\hat{a}^\dagger]\hat{\rho}\right) \tag{24}$$

$$= -i\omega\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{a}^\dagger\hat{a}\hat{\rho}\right) + i\omega\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{\rho}\hat{a}^\dagger\hat{a}\right) \tag{25}$$

$$+ \gamma(\bar{n}+1)\,\text{tr}\left(\hat{a}^\dagger\hat{a}^2\hat{\rho}\hat{a}^\dagger\right) - \frac{\gamma(\bar{n}+1)}{2}\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{a}^\dagger\hat{a}\hat{\rho}\right) - \frac{\gamma(\bar{n}+1)}{2}\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{\rho}\hat{a}^\dagger\hat{a}\right) \tag{26}$$

$$+ \gamma\bar{n}\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{a}^\dagger\hat{\rho}\hat{a}\right) - \frac{\gamma\bar{n}}{2}\text{tr}\left(\hat{a}^\dagger\hat{a}^2\hat{a}^\dagger\hat{\rho}\right) - \frac{\gamma\bar{n}}{2}\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{\rho}\hat{a}\hat{a}^\dagger\right) \tag{27}$$

using cyclic permutations of the trace and combining terms we get

$$\text{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{L}\hat{\rho}\right) = i\omega\,\text{tr}\left(\left[\hat{a}^\dagger\hat{a},\hat{a}^\dagger\hat{a}\right]\hat{\rho}\right) + \gamma(\bar{n}+1)\,\text{tr}\left((\hat{a}^\dagger)^2\hat{a}^2\hat{\rho}\right) - \gamma(\bar{n}+1)\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{a}^\dagger\hat{a}\hat{\rho}\right) \tag{28}$$

$$+ \gamma\bar{n}\,\text{tr}\left(\hat{a}\hat{a}^\dagger\hat{a}\hat{a}^\dagger\hat{\rho}\right) - \frac{\gamma\bar{n}}{2}\text{tr}\left(\hat{a}^\dagger\hat{a}^2\hat{a}^\dagger\hat{\rho}\right) - \frac{\gamma\bar{n}}{2}\text{tr}\left(\hat{a}(\hat{a}^\dagger)^2\hat{a}\hat{\rho}\right) \tag{29}$$

Commuting to simplify we get

$$\text{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{L}\hat{\rho}\right) = -\gamma(\bar{n}+1)\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{\rho}\right) - \gamma\bar{n}\,\text{tr}\left(\left[\hat{a}\hat{a}^\dagger,\hat{a}^\dagger\hat{a}\right]\hat{\rho}\right) + \gamma\bar{n}\,\text{tr}\left(\hat{a}\hat{a}^\dagger\hat{\rho}\right) \tag{30}$$

The commutator is equal to 0, and thus we get

$$\text{tr}\left(\hat{a}^\dagger\hat{a}\mathcal{L}\hat{\rho}\right) = -\gamma(\bar{n}+1)\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{\rho}\right) + \gamma\bar{n} + \gamma\bar{n}\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{\rho}\right) = -\gamma\,\text{tr}\left(\hat{a}^\dagger\hat{a}\hat{\rho}\right) + \gamma\bar{n} = -\gamma\left\langle\hat{a}^\dagger\hat{a}\right\rangle + \gamma\bar{n}. \tag{31}$$

Similarly we can find that

$$\text{tr}\left(\hat{a}\hat{a}^\dagger\mathcal{L}\hat{\rho}\right) = -\gamma\,\text{tr}\left(\hat{a}\hat{a}^\dagger\hat{\rho}\right) + \gamma(\bar{n}+1) = -\gamma\left\langle\hat{a}\hat{a}^\dagger\right\rangle + \gamma(\bar{n}+1). \tag{32}$$

Then since $\hat{x}^2$ commutes with $\hat{x}$ (the measurement operator) we can write Eq. (11) the equation

of motion

$$\partial_t \left\langle \hat{x}^2 \right\rangle = \mathrm{tr}\!\left(\hat{x}^2 \mathcal{L} \hat{\rho} \right) \tag{33}$$

$$= \frac{\hbar}{2m\omega} \left(-(\gamma + 2i\omega) \left\langle \hat{a}^2 \right\rangle - (\gamma - 2i\omega) \left\langle (\hat{a}^\dagger)^2 \right\rangle - \gamma \left\langle \hat{a}^\dagger \hat{a} \right\rangle + \gamma \bar{n} - \gamma \left\langle \hat{a}\hat{a}^\dagger \right\rangle + \gamma(\bar{n}+1) \right) \tag{34}$$

$$= -\gamma \frac{\hbar}{2m\omega} \left(\left\langle \hat{a}^2 \right\rangle + \left\langle (\hat{a}^\dagger)^2 \right\rangle + \left\langle \hat{a}^\dagger \hat{a} \right\rangle + \left\langle \hat{a}\hat{a}^\dagger \right\rangle \right) + \frac{i\hbar}{m} \left(\left\langle (\hat{a}^\dagger)^2 \right\rangle - \left\langle \hat{a}^2 \right\rangle \right) + \frac{\gamma \hbar}{m\omega}(\bar{n}+1/2) \tag{35}$$

Since we have

$$\{\hat{x}, \hat{p}\} = i\hbar((\hat{a}^\dagger)^2 - \hat{a}^2) \tag{36}$$

We can write the equation of motion as

$$\partial_t \left\langle \hat{x}^2 \right\rangle = -\gamma \left\langle \hat{x}^2 \right\rangle + \frac{1}{m} \left\langle \{\hat{x}, \hat{p}\} \right\rangle + \frac{\gamma \hbar}{m\omega}(\bar{n}+1/2) \tag{37}$$
